Definition/Description:

This indicator refers to the amount of median income of a specified group of income recipients which divides their income size distribution into two halves, i.e. the incomes of the first half of individuals are below the median, while those of the second half are above the median. Median income is calculated from the unrounded number of individuals <u>with income</u> in that group.

For all other universes (e.g. census families or private households), this statistic was calculated over all units, whether or not they reported any income.
